

Mealybug *Vryburgia trionymoides* (DeLotto) (Pseudococcidae)¹

Ian Stocks²

Introduction

On several occasions in 2011, succulents (Crassulaceae) for sale at retail stores in Florida were found with infestations of the mealybug *Vryburgia trionymoides* DeLotto. A traceback revealed that the succulents originated in California, where this mealybug is known as an occasional greenhouse pest. *Vryburgia trionymoides* was first detected in Florida in 2002 at several discount retailers in Volusia, Lake and Palm Beach counties, and was not detected again until 2005, again in Volusia County. After 2005, *Vryburgia trionymoides* was not seen again in Florida until 2011, when it was spotted in Nassau County.

Distribution

Described originally from Kenya, this species is presumed to be native to Africa. Outside of Africa, it has been intercepted in South Korea (Soo Jung Suh, personal communication, National Plant Quarantine Service, Republic of Korea), once in the U.S. from Mexico (Greg Evans, personal communication, USDA-APHIS-PPQ), and is considered at least locally established in parts of southern California (Gillian Watson, personal communication).

Description

This mealybug is pinkish-purple, with a light coating of white wax over the body, and thick white filaments arising from the tip of the abdomen. The pinkish-purple body color may be obscured by the powdery wax coating. Other mealybug species likely to be encountered on Crassulaceae include *Planococcus citri* (Risso) (citrus mealybug), *Phenacoccus solani* Ferris (solanum mealybug) and several species of *Pseudococcus*. In general, identification requires slide-mounting to observe morphological characteristics.

Biology

Little is known about the biology of this species. It is most commonly collected on succulent plants in the family Crassulaceae. Occasionally, the similar species *Vryburgia brevicruris* (McKenzie), known from California, is found infesting succulents in Florida. Specimens intercepted or

Hosts

Asclepiadaceae - *Caralluma dummeri* (N. E. Br.) A.C. White and B. Sloane, *Huernia* sp.

Aizoaceae - *Aeonium* spp., *Carpobrotus* spp.; *Lithops* sp.

Crassulaceae - *Aeonium* spp., *Crassula* spp., *Dudleya* spp., *Echeveria* spp., *Graptopetalum* sp., x

Pachyveria, *Sempervivum* spp.

Asteraceae - *Senecio* sp.

Liliaceae - *Aloe* sp., x *Amarcrinum* (Gillian Watson, personal communication, CDFSA)

Economic Importance

There are no published reports of economic losses caused by this species. Gillian Watson (personal communication, CDFSA) reports that even though an untreated infestation can kill a plant, it has not had an economic effect on succulent production in California.

Natural Enemies

There is no published report of natural enemies. The Universal Chalcidoidea Database contains records for four species of parasitoids associated with an unidentified *Vryburgia* species, and one species (*Anagyrus fusciventris* Girault) for the related mealybug *V. lounsburyi*, which is also known from California. *Anagyrus fusciventris* is recorded from Florida, and a second species, identified only as *Aphycus* sp., is listed from Florida.
